PROJECT ABSTRACT SUBMISSION

COURSE: ENGINEERING CAPSTONE PROJECT – 1(23IE4053R/23IE4053A) A.Y. 2026 - 2027

TITLE OF THE PROJECT	Adaptive AI-Powered Startup Pitch Evaluation and Investor Simulation Platform	
S. No.	University ID	Name
1	2420090140	MD. Abrar
2	2420030054	Ch.Shanmukh Pramna
3	2420030061	K.Mokshith
4	24200300348	G.Kartik
Name of the Guide		Swapna Reddy

Abstract

Traditional pitch-evaluation tools stop at scoring a static submission; they cannot probe a founder's reasoning the way a real investor panel does. This project proposes an Adaptive AI-Powered Startup Pitch Evaluation and Investor Simulation Platform that conducts a live, conversational pitch interview and adapts its questioning in real time to the strength of each response. Rather than a single evaluator, the system models a panel of distinct AI investor personas — a Business Investor, a Technology Investor, a Marketing Investor, a Finance Investor, and a Devil's Advocate — each probing the pitch from a different angle. An Adaptive Question Engine tracks the depth and confidence of the founder's answers and dynamically escalates or simplifies follow-up questions, so weak answers trigger foundational questions while strong, technically detailed answers are challenged further. The platform accepts an optional pitch-deck upload, automatically extracts key sections such as problem, solution, market, team, and financials, and directs questioning toward whichever sections are missing or weak.

Beyond the interview itself, the system simulates investor deliberation, generating a short discussion among the personas before rendering a collective investment decision with a simulated funding amount and equity ask, or a stated reason for rejection. Performance is captured through multi-dimensional dynamic scoring across innovation, market potential, technology, revenue model, competitive positioning, and presentation quality, alongside supporting analyses such as a competitor comparison, a TAM/SAM/SOM market-size estimate, a Business Model Canvas, and a risk assessment. A structured improvement report translates weaknesses into concrete, actionable suggestions rather than generic feedback, and a practice mode lets founders re-pitch repeatedly, with the system recalling prior weaknesses and progressively raising

the difficulty. Built on a React frontend, a FastAPI backend, and a large language model orchestration layer with a PostgreSQL data store, the platform is designed and delivered following Agile, DevOps, DevSecOps, and MLOps engineering practices. By making the evaluation interactive, personalized, and continuously adaptive, the project demonstrates how intelligent, evolving software systems can meaningfully augment entrepreneurship education and startup mentorship.
